**TECHNOLOGIES** : ASP.Net, AJAX, SQL Server, JavaScript, and HTML & CSS.

### BUSINESS PROBLEM :

In current scenario, the business houses need to make sure that their knowledge and information are the key differentiators and hence our client, a biotechnology company, recognized the fact that Information or knowledge could be only shared on secure network for the employees to access. They wanted to develop an easy web based secure solution to share research specific newsletters and documents within the organization.

### SOLUTION IMPLEMENTATION:

After analyzing the full need of the application, we were focused on developing an internet based application for the employees to share research specific newsletters and documents within the organization. We worked closely with our client's team to provide a secured network with username and password. This application also has an administration module to manage the documents and the contents on the intranet. This online system is a time bound application and hence the old documents are replaced with new documents after the defined time is expired.

### DEVELOPMENT AND RESULTS:

We were able to provide a suitable solution to the client. The client experienced the following benefits -

- User Friendly web solution.
- Online access.
- Secure network.
- Time alerts.
- Easy document management.
